

The Department of Science and Technology (DST) executes its mandate through the implementation of the 1996 *White Paper on Science and Technology*, the national research and development (R&D) strategy and the Ten-Year Innovation Plan (TYIP). The plan aims to make science and technology a driving force in enhancing productivity, economic growth and socio-economic development.

The department's strategic goals are to:

- develop the innovation capacity of the national system of innovation to contribute to socio-economic development
- enhance South Africa's capacity for generating knowledge to produce world-class research outputs and turn some advanced findings into innovation products and processes
- develop appropriate human capital in the science, technology and innovation (STI) sector to meet the needs of society
- build world-class infrastructure in the STI sector to extend the frontiers of knowledge, train the next generation of researchers, and enable technology development and transfer as well as knowledge exchange
- position South Africa as a strategic international R&D and innovation partner and destination through the exchange of knowledge, capacity and resources between South Africa and its regional and other international partners, thus strengthening the national system of innovation (NSI).

Legislation

The DST is governed by the following legislation:

- The Intellectual Property Rights from Publicly Financed Research and Development (IPR) Act, 2008 (Act 51 of 2008): Provides for the more effective use of intellectual property (IP) emanating from publicly financed R&D, through the establishment of the National Intellectual Property Management Office (NIPMO), the Intellectual Property Fund, and offices of technology transfer at institutions.
- The Technology Innovation Act, 2008 (Act 26 of 2008): Intended to promote the development and exploitation in the public interest of discoveries, inventions, innovations and improvements; and for that purpose establishes the Technology Innovation Agency (TIA).
- The South African National Space Agency (SANSA) Act, 2008 (Act 36 of 2008): Establishes the SANSA to promote space science research, cooperation in space-related activities and the creation of an environment conducive to the development of space technologies by industry.
- The Natural Scientific Professions Act, 2003 (Act 27 of 2003): Establishes the South African Council for Natural Scientific Professions, and legislates the registration of professional natural scientists, natural scientists-in-training, natural science technologists and natural science technologists-in-training.
- The National Research Foundation (NRF) Act, 1998 (Act 23 of 1998): Establishes the NRF to promote basic and applied research, as well as the extension and transfer of knowledge in the various fields of science and technology.
- The National Advisory Council on Innovation (NACI) Act, 1997 (Act 55 of 1997): Establishes the NACI to advise the Minister of Science and Technology on the role and contribution

2016/17 SOUTH AFRICA YEARBOOK

SCIENCE AND TECHNOLOGY

of science, mathematics, innovation and technology in promoting and achieving national objectives.

- The Africa Institute of South Africa (AISA) Act, 2001 (Act 68 of 2001): Establishes the AISA to promote knowledge and understanding of African affairs by encouraging leading social scientists.
- The Human Sciences Research Council (HSRC) Act, 2008 (Act 17 of 2008): Provides for the HSRC, which carries out research that generates critical and independent knowledge relative to all aspects of human and social development.
- The Scientific Research Council Act, 1988 (Act 46 of 1988): Refers to the activities of the Council for Scientific and Industrial Research (CSIR), one of the leading scientific and technological research, development and implementation organisations in Africa, which undertakes directed R&D for socio-economic growth in areas including the built environment, defence, the environmental sciences, as well as biological, chemical and laser technologies.
- The Astronomy Geographic Advantage Act, 2007 (Act 21 of 2007): Provides for the preservation and protection of areas in South Africa that are uniquely suited to optical and radio astronomy, and for intergovernmental cooperation and public consultation on matters concerning nationally significant astronomy advantage areas.
- The Geoscience Amendment Act, 2010 (Act 12 of 2010), amends the Geoscience Act, 1993 (Act 100 of 1993), to mandate the Council for Geoscience (CGS) to be the custodians of geotechnical information; to act as a national advisory authority in respect of geohazards related to infrastructure and development; and to undertake exploration and prospecting research in the mineral and petroleum sectors.
- Sanren, which is responsible for the roll-out of a high-speed broadband network to all academic and research institutions in the country, was awarded a private electronic communications network licence exemption under the Electronic Communications Act, 2005 (Act 36 of 2005).
- The Science and Technology Laws, Amendment Act, 2014 (Act 7 of 2014) seeks to, among other things, streamline the process for the nomination and appointment of members of the boards or councils of such entities as well as the filling of vacancies on the boards.

Budget and funding

The DST's budget allocation for 2016/17 was R7 482 billion, the same as it was for 2015/16.

A sum of R2 534 billion from the budget was allocated to parliamentary grants for the following institutions:

- The CSIR – R2,7 billion
- The NRF – R3,8 billion
- The HSRC – R510,5 million
- The TIA – R516,4 million
- SANSA – R296 million
- The Academy of Science of South Africa (ASSAf) – R27,9 million.

Policy mandate and strategies

The DST's major policy documents are the *White Paper on Science and Technology* of 1996, the 2002 National Development Research Strategy (NRDS), the New Strategic Management Model for South Africa's Science and Technology System (2004) – with its Policy on Governance Standards for Science, Engineering and Technology Institutions and Framework for the Development of a National Science and Technology Expenditure Plan – and the 2007 TYIP.

The DST is the custodial coordinator for the development of the NSI and influences this system through key strategies such as the NRDS and the TYIP. The latter, particularly, seeks to contribute to the transformation of the South African economy into a knowledge-based economy, in which the production and dissemination of knowledge will lead to socio-economic benefits and enrich all fields of human endeavour.

National Research and Development Strategy

The NRDS as the basis for the NSI requires performance and responses in three key areas:

- enhanced innovation
- providing science, engineering and technology Human Resources (HR) and transformation
- creating an effective government science and technology system.

A prime objective of the NSI was to enhance the rate and quality of technology transfer from the science, engineering and technology sector by providing quality HR, effective hard technology transfer mechanisms, and creating more effective and efficient users of technology in the business and government sectors.

The White Paper also set out the institutions to be established to promote the development of a well-functioning NSI. These were to be the national Ministry and DST, the NACI, the NRF, the Innovation Fund and national research facilities managed by Government.

The NRDS is aimed at being a key enabler of economic growth alongside other strategies, such as the HR Development Strategy, the Integrated Manufacturing Strategy and the Strategic Plan for South African Agriculture.

Ten-Year Innovation Plan

The TYIP, launched in 2008, aims to assist the establishment of a knowledge-based economy for South Africa, in which the production and dissemination of knowledge lead to economic benefits and enrich all fields of human endeavour.

The missions and platforms under the NRDS were expanded under the TYIP to include grand challenges in space science and technology, energy security, human and social dynamics in development, global change and the bio-economy.

The responsibility for addressing the grand challenges is spread across many government departments.

The TYIP includes long-term goals based on the challenges it identified, which includes:

- becoming one of the top three emerging economies in the global pharmaceutical industry, based on innovative use of

South Africa's indigenous knowledge and rich biodiversity

- deploying satellites that provide a range of scientific, security and specialised services for all spheres of Government, the public and the private sector
- achieving a 25% share of the global hydrogen and fuel cell market with novel platinum group metal catalysts
- becoming a world leader in climate science and responding effectively to the multiple challenges associated with global and climate change.

National Nanotechnology Strategy

The year 2016 marked 10 years since the launch of the National Nanotechnology Strategy (NNS) in 2006. The NNS was implemented to ensure that South Africa is ready to optimally use nanotechnology to enhance global competitiveness and sustainable economic growth.

Nanotechnology promises smaller, cheaper, lighter and faster devices with greater functionality, using fewer raw materials and consuming less energy.

The strategy strengthens the integrated industrial focus of Government and advances the national technology missions that have been identified in the NRDS.

Nanotechnology cuts across biotechnology, technology for manufacturing and information and communication technology (ICT) to improve the country's natural resources sectors and technology to reduce poverty.

The DST, in partnership with the NRF, seeks to promote nanotechnology research through the Nanotechnology Flagship Project (NFP).

The flagship project aims to ensure that South Africa is able to optimally use nanoscience and nanotechnology to enhance the nation's global competitiveness and to promote innovation and economic growth.

In 2016, more than two million people participated in DST-led science engagement activities coordinated by the South African Agency for Science and Technology Advancement (Saasta).

Nanotechnology Flagship Project

The NFP was established with the objective of accelerating national efforts to build the excellence pipeline in R&D capacity by attracting and retaining young scientists and professionals of the highest calibre.

The NFP is a fundamental pillar in the implementation of the NNS. The project ensures that South Africa is able to optimally use nanoscience and nanotechnology to enhance the nation's global competitiveness and to promote innovation and economic

In 2016, the Department of Science and Technology launched a Centre of Excellence for HIV and AIDS prevention. The centre is co-hosted by Centre for the AIDS Programme of Research in South Africa (CAPRISA) and the University of KwaZulu-Natal.

CAPRISA is a well-established, internationally recognised independent HIV and AIDS research centre. The main goal of the centre is to undertake research aimed at understanding and ameliorating the high risk of HIV and AIDS in women, especially young women, in South Africa.

growth. It is geared towards demonstrating the benefits of nanotechnology and its impact on some of the key challenges facing South Africa, which relate to the areas of energy security, improved healthcare, water purification, mining and minerals, and advanced materials and manufacturing.

In June 2016, the DST, in partnership with the NRF and the Saasta, hosted the Nanotechnology Symposium in Pretoria. Themed “Realising the Potential of Nanotechnology in South Africa”, the symposium’s objectives were to:

- engage with the 25 NFP grant holders in their research activities
- share the successes and challenges experienced by national and international researchers in undertaking nanotechnology or nanoscience-based research
- introduce the Nanotechnology Code of Ethics
- provide a platform for nurturing and encouraging partnerships between industry partners and NFP grant holders in advancing nanotechnology development and innovation in line with the objectives set forth in the NNS.

Since 2007, the NFP has generated an investment of R57 million in 25 research grants, comprising 13 full grants and 12 development grants. The rationale for introducing the development grants was to strengthen the nanotechnology research track record of emerging researchers.

The development grant afforded the emerging researchers in this field opportunities to receive mentorship and to access research infrastructure based at the Nanotechnology Innovation Centre at the CSIR.

The investment in the NFP has yielded locally relevant and internationally competitive outputs in pursuit of research excellence and capacity development.

National Bio-Economy Strategy

The science-based Bio-Economy Strategy replaced the National Biotechnology Strategy, which had been in place since 2001.

Through the Bio-Economy Strategy, bio-innovation is used to generate sustainable economic, social and environmental

In November 2016, the Department of Science and Technology (DST) released the results of the second survey on Public Perceptions of Biotechnology in South Africa, undertaken by the Human Sciences Research Council (HSRC).

The results showed that more than half of South Africa’s population believe that genetically modified organisms (GMOs) are good for the economy and many are in favour of purchasing GM food.

The survey showed that most South Africans are aware they are consuming genetically modified food; figures indicate that 48% were aware that they were eating GMOs while 49% believed it was safe to do so.

The first survey conducted in 2004 revealed that public familiarity with the term “biotechnology”, stood at only 21%, while there was a 13% public awareness of GMO consumption. The latest survey commissioned by the DST last year showed that the figures have tripled, 53% and 48%, respectively.

The HSRC said each of these changes signified a major shift in public awareness.

development. The DST is aiming to have biotechnology make up 5% of the country’s gross domestic product (GDP) by 2050.

The Bio-Economy Strategy focuses on three important economic sectors likely to benefit from key drivers on implementation, namely agriculture, health and industry, and environment.

The strategy also focuses on the coordination of numerous committees, government departments, R&D agencies, the private sector, public programmes and funding bodies to achieve its goals.

Role players

Academy of Science of South Africa

ASSAf was formed in response to the need for an academy of science congruent with the dawn of democracy in South Africa – activist in its mission of using science for the benefit of society.

The mandate of the ASSAf encompasses all fields of scientific enquiry and it includes the full diversity of South Africa’s scientists. The Academy of Science of South Africa Act, (Act 67 of 2001) came into operation in May 2002.

ASSAf represents the country in the international community of science academies and in global academic dialogues.

Since its inception, ASSAf has grown from a small, emergent organisation to a well-established academy.

In 2016, 31 new members were elected, of which 35 were women and 32% black people. Of the total membership of 470, 25% are women and 28% black people.

Transitioning to a green economy is one of the key imperatives of Government, as highlighted in the NDP. The use of green technologies is an integral part of the green economy, making this study both timely and important.

The ASSAf celebrated 20 years in the service of society in 2016.

South African Journal of Science

The South African Journal of Science (SAJS) is now in its 112 years of publication. There has been enormous growth in the number of formal submissions to the journal – an average of 20% per year over the past five years. During 2016, some 471 formal submissions were received from 51 countries – 44% from South Africa, 15% from the rest of Africa, 12% from China and 7% from India.

The number of visits to the SAJS website grew from 47 000 in 2014/15 to 52 000 in 2015/16, or 12%. This is an average of 4 330 visits per month. In February 2016, the SAJS website was upgraded to include article-level metrics that indicate the impact of each article published. The SAJS social media pages also showed considerable growth.

InterAcademy Partnership (IAP)

Academies of science and medicine have traditionally aligned themselves into three major global networks – the Global Network of Science Academies, the InterAcademy Council and the InterAcademy Medical Panel – to build on and amplify their individual strengths when facing pressing global issues. These three inter-related organisations have

now formed an umbrella organisation – the IAP – which was launched in March 2016.

The IAP unites more than 100 science academies worldwide. It provides high-quality independent information and advice on science and development to policymakers and the public. It also supports programmes on scientific capacity-building, education and communication. The IAP leads efforts to expand international science cooperation.

In March 2016, three academy networks, the IAP, the InterAcademy Medical Panel and the InterAcademy Council formed the IAP, with the three component parts renamed as IAP for Science, IAP for Health and IAP for Research, respectively. The new partnership will enable the IAP (the old acronym is being maintained) to speak with one voice on issues of science advice and thus, hopefully, have a greater impact in both national and international policy-making communities.

ASSAf hosted the IAP General Assembly and Conference in February and March 2016 in Hermanus. The conference was funded by the DST and the NRF, among others, and was attended by more than 200 delegates.

The conference theme was “Science Advice”, covering five topics: Science Advice Ecosystem, Science Advice in Times of Disasters/Emergencies, Science Advice in the International Arena, Country Readiness for Science Advice and Interplay between Science Advice, Politics and the Media.

Africa Institute of South Africa

The AISA was first established in 1960 as a non-profit organisation. It is a statutory body following the Aisa Act of 2001.

Through the AISA campus, an annual training programme that educates students from universities in research methodologies, the AISA has contributed to fostering a new generation of research specialists. The AISA has also been able to produce some of the finest research on contemporary African affairs by having its dedicated and highly qualified researchers conduct field research every year throughout Africa.

In March 2016, the HSRC-AISA’s 10th annual Africa Young Graduates and Scholars was held at the University of Limpopo under the theme “The Africa We Want”. It focused on the many aspects and dimensions of culture and the role that culture plays in sustainable development, peace and good governance, as well as integration on the continent.

The African Unity for Renaissance International Conference and Africa Day Expo is an annual conference hosted by the HSRC, together with the following partners: Tshwane University of Technology; NRF; Thabo Mbeki African Leadership Institute; DST; Department of International Relations and Cooperation; the International Council for Science; Regional Office for Africa; BrandSA; Kara Heritage Institute; City of Tshwane, and University of Johannesburg.

The 6th annual African Unity for Renaissance International Conference was held in Johannesburg in May 2016 under the theme “The Knowledge, Spiritual and Struggle Heritage for Re-Imagining Innovative Africa”.

Council for Scientific and Industrial Research

The CSIR is a world-class African research and development organisation established through an Act of Parliament in 1945. The CSIR undertakes directed, multidisciplinary research and technological innovation that contributes to the improved quality of life of South Africans. The organisation plays a key role in supporting government's programmes through directed research that is aligned with the country's priorities, the organisation's mandate and its science, engineering and technology competences.

Key issues that the CSIR seeks to address through various interventions include contributing to a vibrant economy and creating employment opportunities; building a capable state that is able to consistently deliver high-quality services for all South Africans; contributing to the development of economic and social infrastructure like transport, energy, water resources and ICT networks; transitioning to a low-carbon economy to improve our ability to understand the long-term effects of climate change and hence assisting government with the formulation of mitigation and adaptation strategies; transforming human settlements; improving health and building safer communities.

To address these issues, the organisation focuses its research and development in the areas of the built environment, defence and security, energy, health, industry, the natural environment, information and communications technology and our emerging research areas such as nanotechnology, synthetic biology and mobile autonomous intelligent systems.

Many of the organisation's scientific discoveries and technological developments are made possible by its state-of-the-art research infrastructure. This includes laboratories, testing facilities, scientific instruments, equipment, machinery, clean rooms and pilot plants that enable the translation of CSIR research into scientific output such as publications, technology demonstrators and intellectual property.

It is the combination of excellence in research, highly skilled staff and world-class infrastructure that help the CSIR ensure a better future through science.

The development of a next-generation additive-manufacturing machine, Project Aeroswift, continued during 2016. The addition of a new laser source enabled the Aerosud-CSIR team to develop solutions to the main technical challenges that were identified during 2015/16.

By the end of 2017, the CSIR will have supported 50 students through the Data Science Skills Development programme. In 2016, 33 third-year computer science electrical engineering and statistics students were trained. Students in this programme provide data-related business solutions to various stakeholders, including government departments and industry.

Other developments in 2016/17 included the establishment of an integrated, multi-sectoral decision-support centre on the CSIR campus. This centre deals with the collection, transmission, collation, storage and analysis of applicable data sets, as well as decision-support frameworks that transform this data into useful inputs for decision-makers.

In January 2016, the South African Marine Research and Exploration Forum (Samref) was launched.

The main vision behind Samref is to see, by 2024, South Africa's knowledge of its marine living natural resources, marine environment, and ocean-related renewable energy resources greatly enhanced through collaborative research with private sector exploration activities.

The primary objective of Samref is to grow public sector research in the marine and oceanic environment through the exploitation of new opportunities presented by explorations and cruises.

Samref will contribute to the successful implementation of Operation Phakisa's B3 laboratory (exploiting the broader research opportunities presented by offshore oil and gas exploration), and give effect to the Marine and Antarctic Research Strategy as it relates to synchronising and strengthening South Africa's research agenda in the marine and Antarctic spheres.

Human Sciences Research Council

The HSRC was established in 1968 as South Africa's statutory research agency and has grown to become the largest dedicated research institute in the social sciences and humanities on the African continent, doing cutting-edge public research in areas that are crucial to development.

It's mandate is to:

- inform the effective formulation and monitoring of government policy
- evaluate policy implementation
- stimulate public debate through the effective dissemination of research-based data and fact-based research results
- foster research collaboration
- help build research capacity and infrastructure for the human sciences.

The council conducts large-scale, policy-relevant, social-scientific research for public sector users, non-governmental organisations and international development agencies.

Research activities and structures are closely aligned with South Africa's national development priorities.

The HSRC's integrated research programmes provide single points of entry – complete with a critical mass of researchers – for interdisciplinary and problem-orientated research.

The HSRC released the Trends in International Mathematics and Science Study 2015 survey results in November 2016. The survey compared standardised mathematics and science test results of the country's Grade 9 learners with similar pupils in 36 countries. Results showed that South African learners were improving incrementally in mathematics and science, but their tests scores still ranked among the lowest in the world.

In February 2017, HSRC launched the 5th South African HIV study, with plans to visit 60 000 South Africans.

In March 2017, the 2015 South African Social Attitudes Survey at the Sowetan Dialogues was released. The HSRC conducted the survey in November and December 2015 on behalf of the Financial Service Board, with close to 3 000 respondents interviewed. The research was designed to be nationally representative of South Africans aged 16 years and older.

National Advisory Council on Innovation

The NACI Act of 1997 mandates NACI to advise the Minister of Science and Technology and, through the Minister, the Cabinet, on the role and contribution of innovation (including science and technology) in promoting and achieving national objectives.

These national objectives include the improvement of the quality of life of South Africans, the promotion of sustainable economic growth and international competitiveness.

The advice should be directed at, among other things:

- coordination and stimulation of the NSI
- promotion of cooperation within the NSI
- structuring, governance and coordination of the science and technology system
- revision of the innovation policy
- strategies for the promotion of all aspects of technological innovation
- identification of R&D priorities
- funding of the science and technology system.

The NACI hosted a stakeholders' workshop in November 2016 in Pretoria. The purpose of the workshop was to provide a platform to discuss the NACI draft report with various stakeholders of the NSI across public and private sectors.

National Research Foundation

The NRF is an independent statutory body established through the NRF Act of 1998, following a system-wide review conducted for the then Department of Arts, Culture, Science and Technology.

The entity incorporates the functions of research-funding agencies that were previously servicing various sections of the research community, namely the former Centre for Science Development of the HSRC and the former Foundation for Research Development, which comprised several national research facilities.

As a government-mandated research and science development agency, the NRF funds research and the development of high-end human capacity and critical research

Good progress was made during 2016/17 in finalising the South African Research Infrastructure Roadmap (SARIR), which includes plans for infrastructure; health, biological and food security; earth and environment; materials and manufacturing; energy; and physical sciences and engineering.

Of the 17 research infrastructures originally proposed by the national research community, 13 remain in the plan after careful review and scrutiny, and the Department of Science and Technology is currently finalising specific proposals on how to prioritise their roll-out.

Funds were earmarked to begin implementing the SARIR plan in 2016/17, and approval was sought to begin with at least four of the selected infrastructures.

SARIR provided for the roll-out of 13 medium to large infrastructures over a five-year horizon, the first seven of which had been initiated by the end of 2017.

The completion of the SARIR to strategically steer and direct national research infrastructure will be a first and major achievement for the country.

infrastructures to promote knowledge production across all disciplinary fields.

The goal of the NRF is to create innovative funding instruments, advance research career development, increase public science engagement and establish leading-edge research platforms that will transform the scientific landscape.

The NRF promotes South African research interests across the country and internationally. Together with research institutions, business, industry and international partners, the NRF builds bridges between research communities for mutual benefit.

In 2016/17, a strategy on multi-wavelength astronomy is to be finalised, consolidating optical, radio and gamma ray astronomy facilities under a single astronomy subagency in the NRF.

In the same timeframe, R237 million was set aside for the NRF's emerging research areas initiatives such as the expanded Thuthuka Funding Framework that supports PhD and postdoctoral research, the expanded NRF postdoctoral placement programme and the professional development programme, which places young researchers at the NRF and science councils.

Over the MTEF, the NRF proposes to allocate R475 million to 15 centres of excellence. The centres support collaboration on long-term projects that are locally relevant and internationally competitive to enhance the pursuit of research excellence and capacity development.

In 2016/17, at an investment of R68 million, the NRF was to place at least 800 graduate and postgraduate students in work preparation programmes under the National Youth Service initiative. Some 695 interns (45% of the participants in the programme) had found employment, while 356 (23%) had left the programme to further their studies. In terms of absorbing interns into employment, the programme has had a 68% success rate. It has been expanded to include graduates from the humanities and social sciences.

The NRF supports a transdisciplinary research agenda at the iThemba Laboratory for Accelerator-Based Sciences. This facility, which has developed a plan for the South African Isotope Facility, will support research in nuclear physics, materials sciences, radiobiology as well as the production of rare and exotic radio-isotopes for the medical industry.

South African National Space Agency

SANSA was created to promote the use of space and cooperation in space-related activities while fostering research in space science, advancing scientific engineering through the development of South Africa's human capital and providing support to industrial development in space technologies.

The objectives of SANSA are to:

- promote the peaceful use of space
- support the creation of an environment conducive to industrial development in space technology
- foster research in space science, communications, navigation and space physics
- advance scientific, engineering and technological competencies and capabilities through human capital

The National Research Foundation and the Council for Scientific and Industrial Research supported 3 239 doctoral students, as well as 9 353 honours and master's students, with an additional 4 175 researchers receiving research grants, in 2016.

development outreach programmes and infrastructure development

- foster international cooperation in space-related activities.
- SANSA continues to provide state-of-the-art ground-station services to many globally recognised space missions, such as National Aeronautics and Space Administration (Nasa) from the United States (USA) and Indian Space Research Organisation Mars missions, as well as Nasa's Orbiting Carbon Observatory-2, which is giving scientists a better idea of how carbon is contributing to climate change, answering important questions about where carbon comes from and where it is stored.

The first remote sensing atlas to be launched in South Africa was launched by SANSA in May 2016. The atlas can be defined as the collection of data about an object from a distance.

Earth scientists use the technique of remote sensing to monitor or measure phenomena found on earth's surface and atmosphere, through satellite and camera technology.

The atlas was developed to cater for a wide range of audiences and has been simplified in such a way that it is easy to understand while getting the message across.

The 40-page atlas covers broad areas such as history of space technology in South Africa, local satellites, application of satellite images, geology, mining, agriculture, woody-cover mapping, water quality, urban planning, urban development and post-floods analysis.

In 2016, SANSA's work produced essential biophysical variables under the Crop Watch for South Africa project, funded through the United Kingdom (UK) Space Agency's International Partnerships in Space Programme with Airbus Defence and Space as collaborator.

SANSA used Landsat data to identify algal concentrations and map the water quality in dams, such as the Vaal and Hartebeestpoort dams. The Single Layer Model unit of the Department of Water and Sanitation uses these satellite data, provided by SANSA, to regulate and monitor water use in compliance with National Water Act, 1998 (Act 36 of 1998), authorise and license water use for irrigation and assess the status of small water bodies at municipal level. SANSA supplied Rand Water with products to monitor algal bloom in the Vaal Dam and developed critical information on dam levels in the Free State during the severe drought experienced from 2015 to 2017.

During 2016, SANSA and Eskom joined forces in a Memorandum of Understanding (MoU) to protect the national power grid from the potentially harmful impact of space weather on the utility's Interconnected Power System. The collaboration entailed data acquisition and communication, space weather incident management, including the use of related tools and event alerts, expert support, joint research and publications as well as public education and training.

Furthermore, SANSA supplied daily MODIS data that was used in the CSIR Advanced Fire Information Management System that warns Eskom and relevant stakeholders on fire episodes that may impact Eskom powerlines.

Technology Innovation Agency

The TIA is a national public entity that serves as a key institutional intervention to bridge the innovation gap between R&D from higher education institutions, science councils, public entities and the private sector.

The mandate of the TIA is derived from the provisions of the Technology Innovation Act of 2008, which established TIA to support Government in stimulating and intensifying technological innovation to improve economic growth and the quality of life of all South Africans by developing and exploiting technological innovations.

In 2015/16, the DST supported 1 276 youth through the TIA. This included support for 52 youth-owned small, medium and macro-enterprises (SMMEs), 951 youth-owned SMMEs that received support from the Technology Stations Programme and 273 individuals who trained through the Innovation Skills Development; 85 of them received international training.

National Intellectual Property Management Office

The NIPMO provides support to the offices of technology transfer at publicly funded research institutions. This has led to significantly improved IP management in State universities and other research institutions.

The NIPMO operational functions is set out in the the IPR Act of 2008. The act allows NIPMO to function independently of the department but operate as a subprogramme within the department in terms of support functions such as HR and ICT.

Since the IPR Act of 2008 came into effect in 2010, the number of disclosures made by technology transfer agencies has tripled, with the number of patents being managed by these agencies doubling.

Since 2011, over 1 000 disclosures have been received by the NIPMO from institutions, of which 71% relate to inventions for patent protection. Of these, 61 have been licensed, with over R4,4 million in revenue accruing to the institutions. A comprehensive survey on the status of IP and associated technology transfer at publicly financed institutions will be released in 2018.

IP rights related to South Africa's valuable IKS will be better protected through the Indigenous Knowledge Systems Bill. This should facilitate economic growth and spin-offs resulting from the application of such knowledge.

Agricultural Research Council (ARC)

The ARC was established in 1990 through the Agricultural Research Act, 1990 (Act 86 of 1990), as amended by the Agricultural Research Amendment Act, 2001 (Act 27 of 2001), and it is the principal agricultural research institution in South Africa.

It is a Schedule 3A public entity in terms of the Public Finance Management Act, 1999 (Act 1 of 1999), as amended by the

National Science Week is a countrywide celebration of science involving various stakeholders and/or roleplayers conducting science-based activities during the week. National Science Week is run in all nine provinces simultaneously at multiple sites per province.

Each year a different theme is chosen and activities are offered around the theme to the target audiences. The theme for 2016 is "Science for Sustainable Development and Improved Quality of Life".

In 2016, the Mzansi for Science portal was created to raise awareness around the role of science, technology and innovation, celebrate unsung South-African heroes and also encourage South Africans to study, support and invest in it.

Public Finance Management Amendment Act, 1999 (Act 29 of 1999).

Its core mandate is to act as the principal agricultural research institution in South Africa to conduct research, drive R&D, drive technology development and the dissemination of information to:

- promote agriculture and related industries
- contribute to a better quality of life
- facilitate and ensure natural resource conservation to alleviate poverty.

The ARC's main functions are to:

- undertake and promote research, technology development and technology transfer
- use the technological expertise in its possession and make it generally available
- publish information concerning its objectives and functions, and establish facilities for the collection and dissemination of information in connection with R&D
- publish the results of research
- establish and control facilities in the fields of research, technology development and technology transfer
- cooperate with departments of government, institutions, persons and other authorities for the promotion and conduct of research, technology development and technology transfer
- promote the training of research workers by means of bursaries or grants-in-aid for research, technology development and technology transfer
- support research, development and technology transfer programmes
- cooperate with persons and authorities in other countries conducting or promoting research, technology development and technology transfer in agriculture.

Council for Mineral Technology and Research (Mintek)

Mintek, South Africa's national mineral research organisation, is one of the world's leading technology organisations specialising in mineral processing, extractive metallurgy and related areas. Working closely with industry and other R&D institutions, Mintek provides service test work, process development and optimisation, consulting as well as innovative products to clients worldwide.

Mintek is an autonomous statutory organisation that reports to the Minister of Mineral Resources. About 35% of the annual budget is funded by the State Science Vote.

As a global leader in minerals and metallurgical innovation, Mintek provides world-class R&D expertise, test work and process optimisation for all mineral sectors at international level. The activities range from initial bench-top investigations to full process flow-sheet development, pilot and demonstration plant design and optimisation of industrial plants.

By March 2016, Mintek had 675 permanent employees: 399 males, 256 females and 20 foreign nationals. Mintek continues to encourage women in science and technology and has increased the percentage of women from 33% in the previous year to 39% in 2016/17.

Externally focused programmes are aimed at developing Mintek's future pipeline of science and engineering candidates by providing undergraduate and postgraduate bursary programmes for full-time study and internships supported by mentoring.

South African Medical Research Council (SAMRC)

The SAMRC is an independent statutory body that coordinates health and medical research activities throughout South Africa. The SAMRC's objectives are:

- promoting the health and quality of life of the population of South Africa
- performing such functions as may be assigned to the SAMRC by or under the MRC Act, 1991 (Act 58 of 1991).

The scope of the organisation's research projects includes tuberculosis, HIV and AIDS, cardiovascular and non-communicable diseases, gender and health, and alcohol and other drug abuse.

With a strategic objective to help strengthen the health systems of the country – in line with that of the Department of Health – the SAMRC constantly identifies the main causes of death in South Africa.

By analysing the causes and categories of death, data would become available to formulate suitable interventions to either prevent diseases in a certain population group or improve the standard of living of people living with existing medical conditions.

In addressing the ills of the people, the MRC, has set up a dedicated funding department to pay for the development of novel treatment regimens, especially vaccines, as well as improved diagnostic tools.

The Department of Science and Technology (DST) released the National Strategy for Multiwavelength Astronomy, which is intended to allow South Africa to use its geographical advantages and maximise the return on investment made in astronomy.

Developed in a consultative process involving the astronomy community, the National Research Foundation and the DST, the strategy highlights the current status of astronomy in South Africa and its importance to the country's socio-economic landscape.

South Africa is now in a remarkable era of astronomy, hosting the Southern Africa Large Telescope and part of the iconic Square Kilometre Array, which are among the world's biggest astronomy projects.

The country's advantages include its geographic location, with access to the southern skies, high-level government support, infrastructure investments, dark skies and radio-quiet zones.

This project is intended to localise the production of new drugs and devices, and thereby allow the South African economy to grow.

The MRC awards scientific excellence with its annual Scientific Merit Awards Gala Ceremony. These awards acknowledge the contributions of established scientists as well as fresh scientists with ground-breaking efforts in their individual fields of science, engineering and technology.

In April 2017, it was announced that the SAMRC in collaboration with the Beijing Genomics Institute was to establish a Whole Genomic Sequencing research facility at its Cape Town facility. The venture aims to boost the provision of precision medicine in South Africa and to provide a positive step towards understanding the genetic composition of the population. Understanding a nation's genetic make-up enables scientists to develop medicine that targets its specific health challenges.

Council for Geoscience

The CGS is one of the national science councils of South Africa and is the legal successor of the Geological Survey of South Africa, which was formed in 1912 by the amalgamation of three former surveys, the oldest of which – the Geological Commission of the Cape of Good Hope – was founded in 1895. The Geoscience Act of 1993 established the CGS in its present form. The Act was later amended in 2010 to establish the Geoscience Amendment Act of 2010.

As a scientific research council, the CGS is mandated to provide for the promotion of research and the extension of knowledge in the field of geoscience as well as the provision of specialised geoscientific services. The CGS's head office is located in Pretoria, with regional offices located in Polokwane (Limpopo), Cape Town (Western Cape), Pietermaritzburg and Durban (KwaZulu-Natal), Port Elizabeth (Eastern Cape) and Upington (Northern Cape).

The CGS provides the following substantially different professional services:

- geophysical airborne and ground surveys
- geophysical data acquisition, processing and interpretation (airborne and ground)
- engineering geosciences, including geotechnical services
- mineral resources development, including mining and minerals services
- water geoscience/hydrological services
- environmental management and rehabilitation
- marine geology, including port surveys
- spatial data and GIS services
- regional geological surveys and map compilations, including core-drilling services.

As the custodian of South Africa's geoscience data, the CGS has regional aeromagnetic, radiometric and gravity coverage of the country.

The CGS is involved in collaborative research projects that form part of its annual programme. These projects keep the CGS abreast with developments in the international geosciences field.

South African Bureau of Standards (SABS)

The SABS is a statutory body that operates as the national institution for the promotion and maintenance of standardisation and quality in connection with commodities and the rendering of services. The SABS:

- publishes national standards, which it prepares through a consensus process in technical committees
- provides information on national standards of all countries as well as international standards
- tests and certifies products and services to standards
- develops technical regulations (compulsory specifications) based on national standards, and monitors and enforces compliance with such technical regulations
- monitors and enforces legal metrology legislation
- promotes design excellence
- provides training on aspects of standardisation.

To maximise its service delivery to the industries it serves, the SABS aligned its activities with seven different industry sectors, each housing the whole range of the SABS services pertinent to a particular industry.

This change ensures easy access to products, faster reaction and turnaround times, and the creation of centres of knowledge excellence that will be easily available to clients.

The seven industry sectors are:

- chemicals
- electrotechnical
- food and health
- mechanical and materials
- mining and minerals
- services
- transportation.

Eskom

The electricity supply industry in South Africa consists of the generation, transmission, distribution and sales, as well as the import and export of electricity. Eskom is a key player in the industry, as South Africa operates most of the base-load and peaking capacity. The enterprise sells electricity to a variety of customers, including municipalities, who distribute power to end users under licence.

Sasol

Sasol's culture of innovation began in the 1950s when it developed its unique blend of coal gasification and Fischer-Tröpsch (FT) technology for its original coal-to-liquids operations at Sasolburg. It has since evolved these operations into fully fledged R&D facilities that form the heart of the Sasol technology R&D group.

Focused FT R&D in the 1980s and 1990s led to the development of the low temperature FT Sasol Slurry Phase process used at Sasolburg, and the high-temperature Sasol Advanced Synthol process used at Secunda.

Sasol Technology's Fuels Technology Division carries out work concerning fuels, lubricants, heating-fuel and road-binding material, R&D as well as new product formulation and testing.

Mpho Mthombeni from Lentheng Middle School in North West was the winner of a National Research Foundation competition to name the South African Astronomical Observatory's new one-metre telescope.

Now called "Lesedi", this new telescope is the first remotely operated South African owned telescope since the establishment of observing locations in Sutherland in 1974.

In addition, Sasol opened the Sasol Fuels Application Centre (SFAC), a state-of-the-art engine and exhaust emission testing and research facility in Cape Town. The SFAC enables Sasol to conduct sea-level engine and emission tests in line with international standards.

In June 2015, Phase 1 of Sasol's Fischer-Tropsch Wax Expansion Project (FTWEP) was successfully commissioned at its Sasolburg Operations in South Africa.

There were 450 engineers and approximately 5 500 construction workers on site of Phase 1, where 7 200 tons of steel were erected and some 600 km of piping was used.

Phase 2 of FTWEP has begun and is expected to be commissioned in the first half of 2017.

The entire project will see Sasol invest R13,6 billion in the South African economy.

In February 2016, Sasol obtained approval from the Mozambique Council of Ministers for its field development plan that will see further hydrocarbon resources developed to support southern Africa growth.

To be developed in phases, the first phase of the Production Sharing Agreement licence area development proposes an integrated oil, LPG and gas project adjacent to Sasol's existing Petroleum Production Agreement (PPA) area.

The PPA area is where natural gas from the Pande and Temane fields is currently produced and processed in a central processing facility before being transported via an 865-km pipeline to gas markets in Mozambique and South Africa.

The Mozambican gas industry is playing an increasingly important role in the regional energy landscape, and this project represents a major milestone in further developing natural resources, which will significantly benefit southern Africa.

ArcelorMittal

ArcelorMittal is a global steel-maker and with some 210 000 employees across 60 countries, the organisation is considered the world's leading steel and mining company.

ArcelorMittal is also the leader in all major global steel markets including automotive, construction, household appliances and packaging; with leading R&D and technology, sizeable captive supplies of raw materials and outstanding distribution networks.

The company has five main operations in South Africa.

The total volume of steel sales in 2016 decreased by 44 000

In 2016, the Department of Science and Technology supported 915 graduate and postgraduate students through its workplace preparation programme, thus enhancing and easing graduate absorption into the job market and into research careers that provide the human capital that will develop the national system of innovation for the future.

tonnes, with export sales declining by 26% due to the oversupply of steel in the global market and the Corex Campaign Extension at Saldanha Works. This was partially offset by local sales, which improved by 8% as a result of improved market share following the closure of Evraz Highveld Steel and Vanadium. Commercial coke and tar sales volumes fell by 22%.

National Health Laboratory Service (NHLS)

The NHLS is the largest diagnostic pathology service in South Africa with the responsibility of supporting the national and provincial health departments in the delivery of healthcare. The NHLS provides laboratory and related public health services to over 80% of the population through a national network of laboratories. Its specialised divisions include the National Institute for Communicable Diseases (NICD), the National Institute for Occupational Health, the National Cancer Registry and the Antivenom Unit.

The NHLS is a public health laboratory service with laboratories in all nine provinces, employing 6 700 people. Its activities comprise diagnostic laboratory services, research, teaching and training, and production of sera for anti-snake venom, reagents and media.

The staff complement of the NHLS increased by 4,2% from 6 693 to 6 987 in 2016.

The number of pathologists increased to 214 from 194, which means the service managed to retain most of its pathologists and to recruit 10,3% more. The number of medical technologists increased from 1 329 to 1 364, a percentage increase of 2,63%. This confirms that the NHLS is a leader in the health sector, as core professionals are opting to stay with the organisation, where an environment allows them to thrive, and professionals in these occupational categories have left their respective employers in 2016 to join the NHLS.

There is a 13% increase in the number of medical technicians and 6,4% improvement in the number of medical scientists.

In 2016, the NHLS achieved a five-star scoring through the African Society for Laboratory Medicine external audits. The African Society for Laboratory Medicine was established to evaluate and recognise the progress of laboratory Quality Management Systems using the World Health Organisation's Africa Stepwise Laboratory Improvement Process towards Accreditation checklist. The Northdale Laboratory in KwaZulu-Natal has obtained a five-star rating, which is the highest rating on the checklist.

National Institute for Communicable Diseases

The NICD is a major global player in infectious disease intelligence. It is a resource of knowledge and expertise in regionally relevant communicable diseases to the South African Government, to SADC countries and the African continent.

The NICD assists in the planning of policies and programmes and supports appropriate responses to communicable disease issues.

Control methods are assessed and recommendations are made to the appropriate authorities regarding equipment, insecticide usage and application.

In 2012 mLab Southern Africa launched as a mobile technology accelerator with the aim of supporting innovative new startups and to unlock the mobile apps economy.

Since then, the programme has grown to include programmes that support skills development through its own and partner code academies through facilitated co-creation seasons with industry and public sector partners. mLab Southern Africa continues to build on its successes as a local tech startup accelerator.

In 2016, the DST secured co-funding of R17,7 million over the following three years to expand the mLab to Kwazulu-Natal, the Northern Cape and Limpopo.

The mLab programme will provide at least 450 young people with mobile application development training and support.

The DST also plans to support or strengthen 54 more start-ups and expand to other provinces.

Bureau for Economic Research (BER)

The BER monitors and forecasts macroeconomic economic and sector trends, and identifies and analyses local and international factors that affect South African businesses.

The organisation has built up and continues to expand its business tendency surveys and macroeconomic forecasting capabilities. Both are used for analysing and projecting South African macroeconomic trends. The BER uses a variety of internationally accepted methodologies and econometric models for the generation and analysis of the data, as well as techniques developed specifically for the unique South African environment. Other activities include commissioned research, courses, conferences and training.

The BER's respected economic analysis and forecasting services are used by a wide range of clients, ranging from small to medium-sized firms up to very large JSE-listed companies, as well as public sector bodies and NGOs. Financial and investment companies, local and overseas banking groups, multilateral organisations and academic bodies all make use of the impartial economic information available from the BER.

Although the BER is part of the University of Stellenbosch, it has to fully fund all its expenses (such as salaries, a university levy, office rent, travel costs and other) from the sale of forecasts, sponsorships and customised research.

Institute for Economic Research on Innovation (IERI)

IERI was established as a public-good research organisation with a core competence in the analysis of systems of innovation. Its mandate is to provide research, capacity-building and community engagement in this field of study.

Its tasks involve:

- conducting research into the political economy and policy dimensions of innovation and development
- contributing thought leadership on the relationship between knowledge and development across economic, social and political domains
- building capabilities and competencies in the understanding

of the political economy and policy dimensions of innovation and development

- focusing across local, provincial, national, regional and international geographies.

Institute for Security Studies (ISS)

The ISS aims to enhance human security to enable sustainable development and economic prosperity in Africa. It works across the continent, doing authoritative research, providing expert policy advice and delivering practical training and technical assistance.

The ISS achieves its goal through the work of the following divisions and projects. The divisions are:

- governance, crime and justice
- conflict prevention and risk analysis
- peace operations and peacebuilding
- transnational threats and international crime.

The ISS is registered as a non-profit trust in South Africa and is accountable to a board of trustees. An international advisory council meets annually to advise the ISS on strategic policy and management issues.

South Africa's National Energy Development Institute (Sanedi)

The DST and the Department of Energy are joint custodians of Sanedi and assist in providing political and strategic focus for the company.

The institute is entrusted with the coordination and undertaking of public interest energy research, development and demonstration.

As such, it is responsible for enabling and implementing the energy technology roadmaps, which support long-term energy policies developed by the Department of Energy.

Safety in Mines Research Advisory Committee

The activities of the Safety in Mines Research Advisory Committee are aimed at advancing the safety of workers employed in South African mines.

The committee is a statutory tripartite committee of the Mine Health and Safety Council. It has a permanent research-management office managing the rock engineering, engineering and mine occupational health fields of research.

National Agricultural Research Forum (NARF)

The mission of the NARF is to facilitate consensus and integrate coordination in the fields of research, development and technology transfer to agriculture to enhance national economic growth, social welfare and environmental sustainability.

NARF's activities are implemented by the NARF Secretariat, which is situated in the national Department of Agriculture.

The NARF Secretariat is responsible for providing sectoral support to the NARF Plenary and Steering Committee, composed of representatives of NARF's stakeholders headed by a chairperson who, in turn, is responsible to the NARF Plenary session. The Plenary is the highest organ of the NARF.

One of the priorities of the Department of Science and Technology (DST) in 2016 was the establishment of a sovereign innovation fund. This fund is a priority for public-private funding partnerships aimed at commercialising innovations from the public and the private sector. This fund was to be implemented in conjunction with departments of trade and industry, economic development, small business development and other interested parties.

In 2016, the DST made an investment of R137 million in the existing seven sector innovation funds. Of this amount, R84 million is in the agricultural sector and R51 million in the manufacturing sector.

Industry is currently providing new funding of R56 million for the sector innovation funds. The DST has made significant gains in building relevant innovation capacity. Through these initiatives, the DST supported 189 students at honours, master's and doctoral levels, as well as 11 interns. The programme has also generated 20 innovation products and 19 journal publications.

Water Research Commission (WRC)

The WRC was established in 1971 following a period of water shortages. The WRC is responsible for:

- promoting coordination, cooperation and communication in the area of water R&D
- establishing water-research needs and priorities
- stimulating and funding water research according to priority
- promoting the effective transfer of ICT
- enhancing knowledge and capacity-building within the water sector.

The WRC focuses on five key strategic areas:

- water-resource management
- water-linked ecosystems
- water-use and waste management
- water use in agriculture
- water-centred knowledge.

The main areas of research are surface hydrology, groundwater, hydrometeorology, agricultural water use, water pollution, municipal effluents, industrial water and effluents, drinking water, membrane technology, water ecosystems, hydraulics, mine-water management, water policy, developing communities and the transfer of technology.

In June 2016, the WRC was honoured with the Water Award 2016 during the Prince Albert II of Monaco Foundation's 10th anniversary gala dinner. It received the prestigious award for its contribution towards a better understanding of the environment and its outstanding work in South Africa in the field of sustainable water resources, water supply and sanitation.

Institute for Water Research

The Institute for Water Research is a multidisciplinary research department of Rhodes University in the Eastern Cape. Its main objective is to contribute to sustainable water-resource management in southern Africa.

This is achieved through scientific research into the structure and function of aquatic ecosystems; the application of research through specialist consultancy services; tertiary-level teaching and training; capacity-building for community development; and

service on national and international management and policy-making committees.

South African National Biodiversity Institute (SANBI)

SANBI leads and coordinates research, and monitors and reports on the state of biodiversity in South Africa.

The institute provides knowledge and information, gives planning and policy advice and pilots best-practice management models in partnership with stakeholders.

SANBI engages in ecosystem restoration and rehabilitation, leads the human capital development strategy of the sector and manages the National Botanical Gardens as “windows” to South Africa’s biodiversity for enjoyment and education.

South Africa is one of the most biologically diverse countries in the world, after Indonesia and Brazil. South Africa is surrounded by two oceans, occupies only about 2% of the world’s land area, but is home to nearly 10% of the world’s plants, 7% of the reptiles, birds and mammals as well as 15% of known coastal marine species. The country has nine biomes, three of which have been declared global biodiversity hotspots.

Coastal and marine research

The NRF supports marine and coastal research in partnership with the DEA and the South African Network for Coastal and Oceanic Research.

The Chief Directorate: Marine and Coastal Management advises on the use of marine living resources and the conservation of marine ecosystems, by conducting and supporting relevant multidisciplinary scientific research and by monitoring the marine environment.

Sustainable use and the need to preserve future options in using marine ecosystems and their resources are guiding objectives in the research and advice provided by the chief directorate.

National research facilities

The national research facilities managed by the NRF are clustered on the basis of their areas of specialisation aligned to the science missions of the NRDS.

South African Astronomical Observatory (SAAO)

The SAAO is the national centre for optical and infrared astronomy in South Africa. Its prime function is to conduct fundamental research in astronomy and astrophysics by providing a world-class facility and by promoting astronomy and astrophysics in southern Africa.

The SAAO contributes to South Africa’s future development by creating and disseminating scientific knowledge, providing research infrastructure and providing an interface between science and society. It is also responsible for managing the operations of the South African Large Telescope.

Hartebeesthoek Radio Astronomy Observatory (HartRAO)

HartRAO is a national facility of the NRF. Its radio astronomy research focuses on stellar evolution, pulsars and masers; and its Space Geodesy research uses space-based techniques to study the earth. The facility is also used by university students for carrying out research, it also undertakes science awareness programmes for schools and the general public.

In 2016, the DST merged the HartRAO and the SKA project into a new South African Radioastronomy Observatory.

South African Institute for Aquatic Biodiversity (SAIAB)

A national facility of the NRF, the SAIAB is famous for its association with the discovery of the enigmatic coelacanth and is internationally recognised for ichthyological research, dynamic research staff and active postgraduate school. The SAIAB provides unique skills and infrastructure support in marine, estuarine and freshwater ecosystems research, molecular research, collections and bioinformatics.

South African Environmental Observation Network (SAEON)

The SAEON is a business unit of the NRF and serves as a national platform for detecting, translating and predicting environmental change through scientifically designed observation systems and research. The SAEON also captures and makes long-term datasets freely accessible, and runs an education outreach programme. The SAEON has six nodes dispersed geographically across the country.

National Zoological Gardens (NZG)

The NZG is a rapidly transforming facility reporting to the NRF. It has an impressive animal collection, conservation centres, a Centre for Conservation Science as well as an NZG Academy. The NZG is well placed as an education and awareness platform for visitors comprising educators, learners, students, special interest groups and the general public.

iThemba Laboratory for Accelerator-Based Sciences

The iThemba Laboratory for Accelerator-Based Sciences is the continent’s largest facility for particle and nuclear research as well as one of only a handful of facilities in the world producing radionuclides for commercial, research and medical applications. In addition, its facilities include a full radiotherapy clinic for the treatment of certain cancers using both proton and neutron therapy.

South African Council for Natural Scientific Professions (SACNASP)

A new council for the SACNASP was appointed and inaugurated in June 2015. The SACNASP’s mandate is to provide a credible professional registration and regulatory body

that allows natural scientists to establish, direct, sustain and ensure a high level of professionalism and ethical conscience in the natural scientific professions sector. The new council was appointed for four years, from May 2015 to April 2019.

Programmes and projects Alternative energy solution

In November 2014, the DST officially launched the innovative 2,5 kW hydrogen fuel cell power generator prototype unit at the University of the Western Cape.

The generator demonstrates South Africa’s innovative capabilities in the emerging hydrogen and fuel cell technologies space.

The prototype was developed by the HySA Systems Integration and Technology Validation Centre of Competence (HySA Systems) in collaboration with Hot Platinum (Pty Ltd), a local company involved in power management and control electronics.

The partners have been testing the unit at the Cape Flats Nature Reserve, at the Bellville campus of the University of the Western Cape.

All electrical power used in the reserve is generated from a bank of hydrogen cylinders, instead of from the national grid. The cylinders release hydrogen in the presence of a platinum catalyst (mined in North West) and a series of proton exchange membranes.

The hydrogen fuel cell power generator unit uses hydrogen to generate electrical power, with water vapour the only byproduct. In this way, electricity is produced in an environmentally friendly way without pollution or noise.

Furthermore, hydrogen can be used to produce electricity in remote areas that do not have access to the national grid. The decentralisation of energy generation by using hydrogen fuel cell systems is one of the few possibilities for providing efficient and cost-effective access to electricity.

The South African Government has rolled out several energy and energy-efficiency programmes and initiatives, such as HySA, with an emphasis on alternative energy opportunities and off-grid renewable energy solutions.

South Africa is one of the primary suppliers of platinum group metals to the world, but not much beneficiation is being done in the country.

The rise of hydrogen fuel cell technologies in various markets is about to change the global platinum landscape with the anticipated increase in platinum usage in this emerging market.

Prof Celia Abolnik, from the University of Pretoria, a research chair working on poultry diseases, was among the winners of the 2016 Kwame Nkrumah African Union (AU) prizes for science excellence. Tshwane University of Technology’s Prof Felix Dakora, a research chair working on soil chemistry and biology to improve agricultural output, was another Kwame Nkrumah AU prizewinner.

Dr Nomakholwa Stokwe of Stellenbosch University and Dr Wesley Doorsamy of the University of Johannesburg were among 22 exceptional early career scientists selected for the prestigious African Academy of Sciences Affiliates Programme in 2016.

There were significant opportunities for South Africa to partner with international fuel cell producers. These partnerships have the potential to make the country an established hub for the production of fuel cell components.

By May 2017, the DST had raised close to R40 million in support of the 2020 target for hydrogen fuel cell technologies. It plans to continue discussions with stakeholders across Government and the private sector to leverage the remaining R60 million needed to support the deployment of the technology.

Subprogrammes

The DST also has a number of subprogrammes that play a pivotal role in ensuring that the department meets its targets. They are:

- **Human Capital and Science Promotion:** Formulates and implements policies and strategies that address the availability of human capital for STI, and provides support for research activities.
- **Science Missions:** Promotes the development of research, the production of scientific knowledge, and the development of human capital within science areas in which South Africa enjoys a geographic advantage.
- **Basic Science and Infrastructure:** Facilitates the strategic implementation of research and innovation equipment and infrastructure to promote knowledge production in areas that are of national priority and to sustain innovation led by R&D.
- **Astronomy:** Supports the development of astronomical sciences around a research strategy on multi-wavelength astronomy, provides strategic guidance and support to relevant astronomy institutions in the implementation of the DST's astronomy programmes.
- **Sector Innovation and Green Economy:** Provides support in policy, strategy and direction setting for R&D-led growth in strategic sectors of the economy; supports the transition to a green economy.
- **Innovation for Inclusive Development:** Supports the development of science and technology-based innovations for tackling poverty, including the creation of sustainable jobs and sustainable human settlements, as well as the enhanced delivery of basic services.
- **Science and Technology Investment:** Leads and supports the development of indicators and instruments for monitoring investments in science and technology and the performance of the NSI, as well as ways of strengthening policy in relation to the NSI.
- **Technology Localisation, Beneficiation and Advanced Manufacturing:** Advances strategic medium and long-term priorities for sustainable economic growth and sector development, and public service delivery.

Research, Development and Innovation

This is at the heart of the DST's efforts to drive innovation in scientifically strategic areas.

The programme has five subprogrammes:

- Space Science and Technology
- Hydrogen and Energy

- Biotechnology and Health Innovation
- Innovation Planning and Instruments
- Radio Astronomy Advances.

Space science and technology

Square Kilometre Array

The multibillion-rand SKA, to be hosted in South Africa and Australia, will eventually extend into eight African countries and will be the world's biggest telescope. It is also one of the biggest-ever scientific projects and multinational collaborations in the name of science.

The radio telescope should be operationally mature by 2020.

With thousands of linked radio wave receptors in Australia and in southern Africa, the SKA radio telescope will constantly scan space and feed the data to astronomers around the world.

The amounts of data being collected and transmitted by the SKA in a single day would take nearly two million years to play back on an iPod. This means the project requires supercomputing power and Big Data Management and Analytics capabilities on an unprecedented scale. The SKA is working with the world's most significant ICT powerhouses on the project.

One aspect of the project will see the Netherlands Institute for Radio Astronomy and IBM collaborating to research extremely fast, but low-power exascale computer systems, data transport and storage processes, and streaming analytics that will be required to read, store and analyse all the raw data that will be collected daily.

The SKA project will also have unprecedented data-connectivity needs. Meeting the advanced technological and engineering needs of this project will result in significant local

skills development, revolutionise science and technology research and enable innovative new businesses and employment in the science, technology and engineering fields.

Aside from the benefits to African science, Big Data Management and Analytics capabilities could be the biggest spin-off from the SKA project.

The innovations, skills development and commercial potential emerging as a result of the project are huge. The potential is not just academic – the taxpayer-funded IP is developed to a point where it is ready to become commercialised and benefit the economy.

Human capital development is already taking place as a result of the SKA project, with bursaries and scholarships being granted to allow students to learn the necessary cutting-edge science, technology, mathematics and engineering skills to support the project. Because the SKA is a long-term project over decades, its effect will increase.

The Centre for High Performance Computing is a member of the international SKA Science Data Processing Consortium. With funding from the DST, it is also supporting eight African SKA partner countries through an initiative where they have installed its new supercomputer to provide 1 000 teraflops (1 petaflop) of computing power to researchers. The facility was upgraded to meet the growing demand for use by university and industrial researchers. The SKA remains a major platform for cutting-edge innovation in domains such as supercomputing the high-speed transmission and processing of massive data sets.

Going forward, there will be a strong drive to leverage the SKA as a spearhead for other programmes – including next generation high performance computing challenges and Big Data challenges.

A total 45 antennas and 57 pedestals were expected to be installed by May 2017 as part of MeerKAT and the DST was on track to build the full complement of 64 by 31 March 2018. MeerKAT has reached another milestone with the integration of the 32 antennas into a polarisation correlator or array. The next array release, AR2, was set for later in 2017.

Furthermore, 75% of MeerKAT's components were sourced locally. To date, MeerKAT has spent R134 million on local construction suppliers and 351 people have been trained by major SKA contractors such as Stratcom. The SKA project has created 7 284 employment opportunities through the construction of the KAT-7, MeerKAT and related projects.

The SKA Human Capital Programme is aimed at developing a new generation of young researchers and engineers. By its 11th year, the SKA bursary initiative had funded 919 students, 133 of whom were from other African countries, from undergraduate to postdoctoral level.

Astronomy courses are also being implemented in other African countries, including Kenya, Mozambique, Madagascar and Mauritius. Career opportunities will increase substantially and new business opportunities will emerge.

Information and communications technology

The DST is leading the implementation of the national ICT Research, Development and Innovation Strategy. Its

main purpose is to create an enabling environment for the advancement of ICT research, development and innovation in South Africa.

South Africa's research capacity in the ICT field has become a strong competitive advantage.

The ICT Research, Development and Innovation Strategy aims to achieve a marked increase in advanced HR capacity, promote world-class research and build robust innovation chains for the creation of new high-tech ICT small enterprises. Implementing the strategy demands partnership involving Government, the private sector, higher education institutions and science councils.

Some R451 million has been leveraged from industry partners for South African ICT Research, Development and Innovation through these partnerships. In 2016, a further allocation of R24 million was made to continue with existing partnerships and to attract new private sector investment in this initiative.

The Meraka Institute of the CSIR manages and coordinates the implementation of the strategy. An important envisaged outcome is a vibrant, sustainable and innovative indigenous ICT industry that addresses a significant portion of the country's ICT needs and attracts investments by overseas-based multinational ICT corporations in research, development and innovation and manufacturing facilities and resources in South Africa.

The Centre for High-Performance Computing (CHPC), SANReN and the Very Large Databases are the three pillars of cyberinfrastructure that the DST supports. Hosted by the University of Cape Town and managed by the CSIR's Meraka Institute, the CHPC was the first of its kind in South Africa and is making scientific supercomputing a reality for South Africa.

A major project for SANReN is the national backbone network, which aimed to connect all major metros in the country with a 10 gigabyte per second link.

SANReN, linking 215 research sites, consists of 1 500 km of dark fibre and 5 000 km of managed bandwidth. This network is complemented by significant international broadband capacity on the West Africa Cable System and the east coast SEACOM system, ensuring that the DST's projects support competitive research and innovation as it prepares the national innovation system for the future.

SANReN connects more than 200 sites from Thohoyandou to Cape Town. This includes all the main campuses of all South African universities and most public research institutions, as well as global projects such as the SKA and the MeerKAT.

Indigenous knowledge systems (IKS)

The Indigenous Knowledge System Policy serves as a guide for the recognition, understanding, integration and promotion of South Africa's wealth of indigenous knowledge resources.

One of the areas of action identified by the policy is the protection of indigenous knowledge and the holders of such knowledge against exploitation.

This includes ensuring that communities receive fair and sustained recognition and, where appropriate, financial remuneration for the use of this knowledge.

The indigenous knowledge of many communities embodies a deeply spiritualised and ancient relationship with the Earth's systems and cycles.

Traditional songs and languages, clothing, architecture, foods, motifs, daily rituals and mythological epics contain local survival information. Moreover, the diversity of indigenous cultures provides unique insights into how to live harmoniously within nature.

By sharing indigenous stories of vulnerability and adaptation, people learn how communities share ideas on how ancestral wisdom is being incorporated into climatic adaptation strategies.

By cherishing the value of indigenous knowledge, people can discover how best to adapt to a changing climate.

The DST has three IKS priorities:

- The development of a regulatory environment for the protection of IKS.
- The development of the National Recordal System for the collection, recording, documenting, storage and management and dissemination of IKS in communities in the nine provinces of the country. Until orally transmitted and rapidly disappearing indigenous knowledge is recorded, it will be difficult to protect. The National Recordal System is the largest fingerprint initiative of the region to document and record indigenous knowledge.
- Applied research, specifically bio-prospecting activities. An example would be the Moritela Tshwene Tea Project near Zeerust in the North West.

A major achievement was to put in place an information infrastructure that would hold IKS in oral format. Between 2008 and 2016, DST developed the system and put in place documentation centres in eight provinces, excluding only Gauteng, where a centre would be established in 2017. These centres served as a footprint for the DST to institute the work of documenting IKS.

Over the last four years, the centres have documented 1 870 indigenous knowledge holders registered in the system. Some 9 200 claims were documented and 1 200 full records of those claims have been developed. In 2016, there were only 56 communities participating in the initiative, which linked up with the Department of Environmental Affairs' bioprospective permit applications process.

By 2015, two indigenous knowledge research chairs had been awarded as part of the country's Research Chairs Initiative (SARChI).

In 2015/16, the DST announced plans for 20 new research chairs designated for women applicants, as only 35 out of 150 SARChI chairs were held by women at the time. The DST exceeded this target and awarded 42 new research chairs to successful women applicants, raising the percentage of women in SARChI chairs from 23% to 39%.

In addition, two UK-South Africa bilateral research chairs have been awarded for research into food security; one co-hosted by the universities of the Western Cape and Pretoria and the other based at the Nelson Mandela Metropolitan University.

The DST also established indigenous knowledge studies CoEs at some of the country's universities. The CoEs will play

a defining role in generating highly qualified HR capacity in IKS.

Cooperation with other national state departments and role players

The DST continues to collaborate with district municipalities to build and strengthen science capacity to advance local economic development.

In 2016, it formalised cooperation with the South African Local Government Association (Salga) and the Department of Cooperative Governance and Traditional Affairs.

In 2016/17, the DST is to provide a further R14-million investment to support agroprocessing in distressed municipalities such as Greater Tzaneen and Greater Giyani, both in Limpopo, and Intsika Yethu in Cofimvaba. Young people and women will be specifically targeted for support.

The DST will continue to collaborate with Salga through a partnership with the WRC on the WADER technology demonstration programme: R12,6 million has been allocated for the implementation of the Water Research, Development and Innovation Roadmap.

The DST piloted a grassroots innovation initiative in 2016/17 with a R2 million investment that will focus on supporting innovators and technology entrepreneurs in the informal sector and in marginalised communities.

Private-sector involvement

South Africa's gold-mining industry works at deeper levels and under more difficult conditions than any other mining industry in the world.

The research into gold mining conducted by the CSIR's Mining Technology Group is concerned primarily with ensuring the health and safety of the workforce.

It includes those working in the areas of rock engineering and the underground environment.

Mining Technology's coal-mining research takes place on a smaller scale than that of gold mining, because the coal-mining industry is able to make use of various developments overseas.

Areas in which research is undertaken include strata control, mining, maximising the extraction of coal and the underground environment.

Research is also carried out by a large number of industrial companies with facilities to meet their specific needs.

In 2015/16, the DST announced its continued investment through Pelchem in the Fluorochemical Expansion Initiative. Pelchem is making good progress in the expansion initiative and the DST continues to fund the initiative through R45 million announced in 2015/16. Success will allow Pelchem to develop promising new technologies and fluorochemical products and to double their turnover to R400 million a year by 2019.

The new Auckland Park-based Mining Precinct, in Johannesburg, was launched in November 2016. It aims to safeguard the future of South Africa's mining industry through developing new people-centred technology and techniques to empower mines and prepare them for modern mining methods.

The Mining Precinct aims to arrest the current general decline in the local mining industry in South Africa and to help it overcome significant obstacles in the future, which stem from narrower ore bodies and mines having to venture to deeper depths to find reserves.

The Mining Precinct is situated at a CSIR site, meaning that the public and private sectors are under one roof. Cooperation between public and private sectors is one of the great outcomes of the Mining Phakisa, forming a coalition of those willing to take the South African mining industry into a modernised future.

The Mining Precinct model creates an environment where “like-minded” people can work in close proximity and share ideas. It will host different hubs that will focus on mining technology, manufacturing and sustainable development.

In addition, the Mining Precinct is complemented by the equipment-focused representative organisation Mining Equipment Manufacturers South Africa (Memsa), which was launched by the Department of Trade and Industry.

Memsa is hosted within the Mining Precinct and is working in close collaboration with the mining (R&D) hub and local mining companies to determine their current equipment stocks, future needs and potential future order quantities to develop a better understanding of the possibilities related to future mining equipment.

This collaborative effort aims to link to other institutions, such as universities and research entities nationally and internationally.

Natural resource development

To reinvigorate the South African mining sector and to harness the vast amounts of existing and potential opportunities for industrial and manufacturing growth, it is crucial for the country to create the technologies and mining methods to push mining deeper in a commercially viable manner. Now, more than ever, South Africa needs a competitive mining industry. This will only be possible if science and technology plays the quintessential role of changing the cost and exploitation horizons of the sector. None of the existing mining stakeholders (publicly funded research institutions, private sector companies, universities, unions or Government) have the scale to impact the situation alone over the long run. To achieve this, a critical mass of science and knowledge to push the frontiers of mining will require a national effort consisting of deep partnerships and collaborations across institutions and industries.

Human capital development

The DST’s Human Capital and Science Platforms Subprogramme conceptualises, formulates and implements programmes aimed at developing and renewing science, engineering and technology human capital to promote knowledge generation, protection and exploitation.

South African universities train more and more scientists each year, with whose help the country will be able to provide top-notch R&D and thus reaching its target for gross expenditure on R&D of 1,5% of GDP.

Food security and access to clean water remain among Government’s top priorities – the department is therefore also focusing on using science and technology to ensure that existing water supplies are clean and is playing an active role in ensuring food security into the future.

To this end, seven of the 60 new research chairs initiated by the department will serve the areas of rural development, food security and land reform, bringing the total of such chairs to 10.

In 2016, an amount of R4,2 billion was allocated to the DST’s Research Development and Support branch. In the same year, the DST invested R741 million in supporting 14 500 postgraduate students (black: 9 715 (67%), female: 8 265 (57%). The DST is the largest funder of postgraduate students in the country.

International Cooperation and Resources

The DST is not only entrusted with the overall coordination of national research and innovation initiatives in South Africa, but is also responsible for overseeing and facilitating South Africa’s international scientific and technological cooperation.

The International Cooperation and Resources Programme’s purpose is to:

- strategically develop, promote and manage international partnerships that strengthen the NSI
- enable an exchange of knowledge, capacity and resources between South Africa and its international partners, with a focus on supporting STI capacity-building in Africa
- support South African foreign policy through science diplomacy
- complement South Africa’s national investments in STI, including access to resources for department initiatives that require external investment, by securing international funds of R1,4 billion by 31 March 2018
- maintain the number of researchers awarded research grants through NRF-managed programmes at 13 617 by the end of 2016
- maintain the number of International Science Indexing or ISI-accredited research articles published by NRF-funded researchers at 21 000 by mid-2016
- strategically develop priority science areas in which South Africa enjoys a competitive advantage
- promote South Africa as a preferred partner for international science and technology cooperation.

South Africa is regarded by many countries and private sector partners as a preferred and privileged partner for international cooperation in STI. On average, approximately 15% of annual R&D funding in South Africa comes from international investors.

Cooperation with other African partners and support for STI capacity-building in Africa remains a strategic priority for the DST. In this context, accessing its extensive network of international partners, the DST managed to secure R113 748 000 from international partners to support collaborative projects in Africa.

The DST itself has invested in 61 jointly funded projects with African partners, for example Egypt, Kenya, Tunisia and Zambia. In the multilateral context, the DST actively supported 13 African Union and Southern African Development Community (SADC) partnership initiatives.

The DST’s International Cooperation and Resources branch has been allocated R124 million to enhance its science diplomacy work. This is to support strengthening and managing the DST’s dynamic and diverse portfolio of relations with a range of international partners.

A recently released Organisation for Economic Cooperation and Development study highlighted that among BRICS (Brazil-Russia-India-China-South Africa trade bloc) nations, South Africa ranked highest in terms of the percentage of scientific papers published by the country’s researchers with international authors, pointing to the country’s status as a sought-after partner for international STI partnership.

Several major multinational companies such as Pfizer, Nestlé and Hitachi have invested in research, innovation and human capital development activities in South Africa in partnership with the DST.

South Africa is also an important strategic partner for such major philanthropic organisations as the Bill & Melinda Gates Foundation, which has invested in programmes to harness STI for poverty alleviation.

South Africa participates successfully in competitive international research funding programmes. In the European Union’s prestigious Horizon 2020 Framework Programme for Research and Innovation, South Africa’s success in terms of the number of projects involving the country’s researchers is, among countries outside Europe, bettered only by the US and Canada.

South Africa continues to provide leadership in the science structures of organisations such as the AU and the SADC. The DST led the preparation of the first BRICS multilateral framework programme for collaborative research and innovation.

In 2016/17, the DST opened a dedicated office in Addis Ababa to support the AU's Space Policy and Strategy, adopted earlier in 2017, as well as the implementation of the STI Strategy for Africa. A DST official remains seconded to the SADC Secretariat in Gaborone.

South Africa's excellence in STI is attracting global attention.

In December 2016, the DST hosted the second Science Forum South Africa at the CSIR International Convention Centre in Pretoria. The event attracted over 1 500 participants from more than 50 countries. The 2016 theme was: "Igniting Conversations About Science".

Women in Science Awards

Top South African women scientists were honoured at the Women in Science Awards ceremony held Johannesburg in August 2016. The theme for 2016 was "Women Empowerment and its Link to Sustainable Development".

The DST hosts these awards annually to reward outstanding female scientists and researchers, and encourage younger women to follow their example.

The winners of the 2016 Women in Science Awards were:

- **Distinguished Young Women Researchers:** Research and Innovation: Dr Muthoni Masinde, for her innovative use of ICT to accurately predict drought-stricken environments.
- **Distinguished Women Researcher in the Humanities and Social Sciences:** Prof Vhonani Netshandama.
- **Distinguished Women Researchers (Physical and Engineering Sciences):** Prof Jane Catherine Ngila.
- **Distinguished Young Women Researchers (Physical and Engineering Sciences):** Prof Esther Akinlabi.
- **Emerging Young Scientist:** Caroline Pule.
- **Doctoral Fellowship Award:** Lucia Makgafele Ntsoane.
